

P3 SERVICES

AI-DLC & ADLC Services

Build the engineering system that turns AI adoption into governed delivery leverage.

P3 SOLUTIONS GROUP

Integrating People, Practices, and Principles

Turn AI Experiments Into an Engineering System

P3 focuses on the gap between developers having AI tools and the organization having a safe, repeatable, measurable AI-driven delivery capability.

Your developers adopted AI. Your engineering system didn't.

Service 1

AI-DLC Readiness & Operating Model Assessment

A focused engagement for engineering leaders who need to understand where AI is already changing delivery, where risk is accumulating, and what should be standardized before autonomy expands.

We examine

- Current AI usage across discovery, coding, review, testing, release, and operations.
- Existing SDLC controls, CI/CD, quality gates, architecture governance, security, and production authority.
- Where AI creates measurable leverage versus where it merely increases activity.
- Capability-versus-authority boundaries for developers, AI assistants, and agents.
- The organization's current maturity from L0 Traditional SDLC through P3 AI-DLC / agentic maturity.

Outputs

- Current-state maturity map and risk/opportunity findings.
- Prioritized AI-DLC adoption roadmap.
- Initial decision-rights and authority model.
- Measurement baseline and recommended outcome metrics.
- A bounded pilot recommendation tied to a real delivery problem.

Engineering Harness & ADLC Pilot

A build-oriented engagement that turns the readiness findings into a working delivery system around one or more real software-delivery workflows.

What P3 builds with your team

CONTEXT + SPECIFICATION

- Repository entry points
- Product/spec handoffs
- Architecture memory
- Reusable commands and skills
- Agent operating context

GOVERNANCE + AUTHORITY

- Decision rights
- Approval gates
- Security boundaries
- Dependency/production policy
- Escalation rules

VERIFICATION + DELIVERY

- CI quality gates
- Testing/coverage integration
- PR evidence
- Release runbooks
- Deployment verification

AGENTIC PILOT

- Bounded agent responsibilities
- Tool/MCP access
- Lifecycle orchestration
- Failure/remediation loops
- Human stop/approval points

The objective

Not a demo. Not a prompt library. A working slice of AI-driven software delivery that can be observed, measured, governed, and improved.

Prove Before You Scale

P3 starts with a bounded delivery problem where improvement can be measured. We instrument the baseline, implement the minimum harness required, run real work through it, and use the evidence to decide what to standardize next.

Typical progression

- **1. Pain:** Select a meaningful delivery constraint - not an AI technology looking for a use case.
- **2. Measure:** Establish baseline outcomes and risk indicators.
- **3. Build:** Add the minimum context, controls, tooling, and workflow needed.
- **4. Prove:** Run real stories/releases through the system and collect evidence.
- **5. Standardize:** Codify validated practices into the organization's engineering harness.
- **6. Scale:** Expand AI participation and agent authority only where the evidence supports it.

Executive outcome: increase engineering leverage without allowing risk, rework, or governance debt to scale at the same rate.

Designed for

CIOs, CTOs, VPs of Engineering, platform leaders, and software organizations that have already adopted AI coding tools but need a coherent operating model for what comes next.
